#### **BUTYL SEALANTS**

Made with refined bitumen and characterised by high elasticity and ability to adhere to porous or irregular surfaces.

BLACK BAND page 45

SUPRA BAND page 46

PROTECT page 48

BUTYL BAND page 49

BUTYL GLUE page 49

**GROUND BAND** page 48

#### **NWF THAT CAN BE PLASTERED OVER**

Products with a NWF (Non-Woven Fabric) support that can be plastered over, usually made of polypropylene. Guarantee good adhesion to plaster and plasterboard.

PLASTER BAND page 41 BORDER BAND page 44

#### **PROFILES**

EPDM plastic and non-plastic materials, with high thermal and chemical stability, durability guaranteed over time long with good resistance to UV rays.

CONSTRUCTION
SEALING page 50
CONNECT BAND page 48

KENAF BAND page 50 ALPHA page 54 TIE BEAM STRIPE page 50

#### SFI F-FXPANDING PROFILES

Product obtained from polyurethane foam. Used to fill in irregular cracks; high elasticity over time.

KOMPRI BAND page 42 FRAME BAND page 43

#### **NAIL POINT SEALANTS**

Butyl tapes and tapes made of closed-cell polyethylene foam. They guarantee water and air tightness even if drilled or trimmed.

NAIL PLASTER page 53 GIPS BAND page 53
GEMINI page 53 NAIL BAND page 53

#### CHEMICAL SEALANTS, GLUES AND PRIMERS

For accurate connections or connections between different materials. High chemical compatibility with the most common surfaces used in the construction sector.

HERMETIC FOAM page 47 SEALING FOAM page 52

glossary

#### Condensation

Let's imagine air as a container: at high temperatures its volume increases, thus absorbing more water vapour. When temperatures cool down, on the other hand, air reduces its volume and the ability to absorb vapour; once the saturation point is reached, the excess vapour is eliminated in the form of condensation (water droplets).

## Air and wind tightness

The continuous <u>air-tight</u> layer prevents internal air from penetrating the thermal shell; the <u>wind-tight</u> layer blocks all external air flows towards the shell, also ensuring waterproofing. They both serve to prevent uncontrolled condensation phenomena.

#### How is a tape made?

**Support** Film to which the adhesive mix and the other components area applied.

**Primer** Layer that serves as a binder between the support and the adhesive.

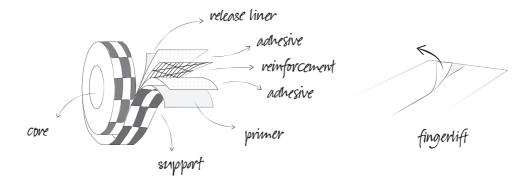

**Release liner** Removable anti-adhesive layer that makes it possible to unwind the tape.

It can be supplied split up into multiple sections in order to facilitate its laying.

**Reinforcement** Polymeric mesh that provides strength and stiffness to the final product.

**Core** Internal Core. Cardboard or plastic cylinder around which the tape is wound.

**Fingerlift** Part of the liner that sticks out in order to simplify its removal.

#### CHOOSE A SEALING PRODUCT OR TAPE

# to which type of surface will it be applied?

Examine the nature of the surfaces and their shape (smooth or rough). Very irregular surfaces require more glue in order to activate the adhesion process.

## ambient: temperature, light, humidity, water?

"Water, sudden temperature changes and exposure to UV rays may shorten the service life of the products. Some products can remain functional despite a humid support surface.

# 

It is necessary to analyse the mechanical stress to which the product will be subjected once it is working. During the application phase, it is important to reduce tension and elongation down to a minimum.

# > standards or requirements to be complied with?

Prior to application, check to see whether any technical requirements must be complied with.

# Does the product have an expiry date?

It is mandatory to comply with the final date, if indicated, within which the product has to be applied. Otherwise, contact the manufacturer or carry out a few practical tests.

#### **HOW TO STORE A TAPE OR SEALING PRODUCT**

Product performance is guaranteed only if the expiry date or additional indications provided by the manufacturer are complied with.

For storage purposes, it is generally appropriate to satisfy specific conditions:

- temperature included between 5 and 25 °C \*
- relative humidity less than 65%
- avoid extreme environmental conditions and direct exposure to heat sources.

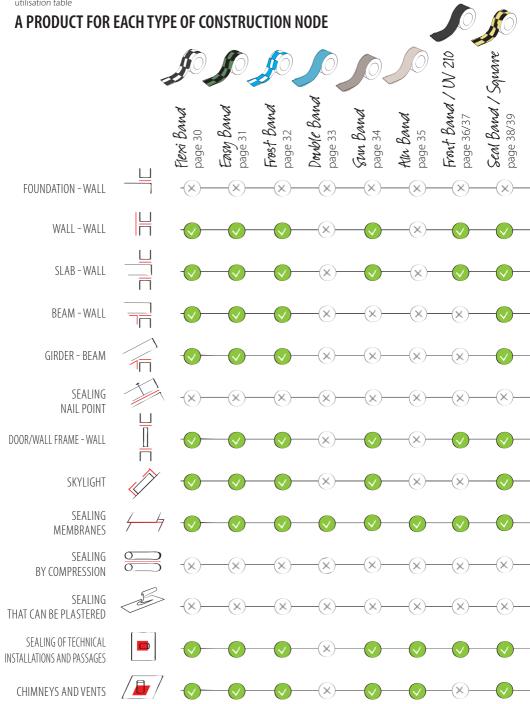

Keep the tapes in their original packing to avoid any direct exposure to sunlight and prevent any contact with dust and dirt.

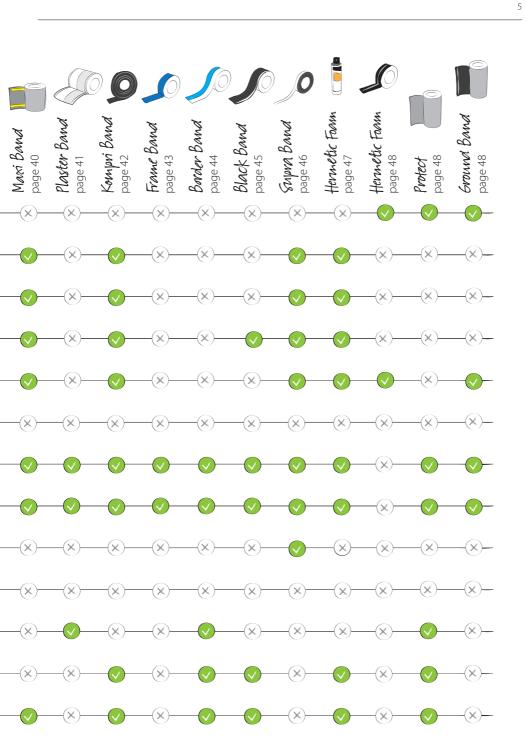

Tapes and profiles must be cut and not torn, in order to prevent any fraying or laceration.

<sup>\*</sup> If stored at lower temperature, the products must be brought to the ideal temperature prior to being used. Certain products may no longer be usable once they have frozen.
